

Get the Most out of Your IPsmarx Wholesale Switch with the Limit Ports Feature

The IPsmarx Wholesale Softswitch comes with the option to limit ports, enabling carriers to manage voice traffic more effectively. In other words, wholesale carriers will have the option to limit the amount of simultaneous calls any given customer or end point carrier may use.

By taking advantage of this feature, carriers can avoid traffic congestion by controlling the amount of calls that are sent to their softswitch or gateways. This also gives Carriers control of the number of simultaneous calls they will accept for a particular destination.

Also, by limiting ports for each customer, carriers ensure that they get the most out of their system's capacity and manage their available bandwidth effectively.

This feature is especially lucrative for Carriers who have multiple gateways scattered across one region. For example, a Carrier that has ten 4-port gateways scattered across UAE will be able to designate a certain amount of traffic per port, therefore limiting the amount of calls received per gateway. This is beneficial for wholesale carriers because it allows them to ensure call connectivity to all of their customers.
